

AI CAREER TOOL

Resume Intelligence

Resume analysis and job matching, with evidence for every score

Sitanshu Sekhar Prusti | B.Tech CSE (IoT), ITER

Why resumes fail before anyone reads them

Automated filtering

Many companies screen resumes with software before a recruiter sees them.

Unclear requirements

Students cannot tell which listed skills a job really needs, or which they already show.

Vague feedback

Advice like "add more projects" does not say what to change or learn.

THE GOAL

Turn a resume and a job description into an evidence-backed action plan

Match, fix, learn, practice

What the platform does

Job match score

Compares every required and preferred skill with lines in your resume and shows the evidence.

ATS-style checks

Tests contact details, section headings, action verbs, numbers and length, with a fix list.

Learning roadmap

Turns missing and partial skills into weekly study and practice tasks with checkboxes.

Interview questions

Generates questions from your strengths, your gaps and the specific role.

How it works

Private by design

Everything runs in the browser, so resumes are never sent to a server.

Technology: built now and planned

Built now: V1 prototype

- HTML, CSS and JavaScript in a single page
- PDF.js to read resume and job PDFs
- Rule-based matching with skill aliases
- Runs fully in the browser, no server

Planned for V3

- React and Tailwind frontend
- FastAPI backend with JWT login
- Gemini API for structured extraction
- Embeddings and ChromaDB for search and RAG
- PostgreSQL for users, resumes and history

How the match score is calculated

1

Split the job description into Required and Preferred lists

2

Check each bullet against resume lines using whole-word matches and aliases

3

Give credit for direct, implied or no evidence

4

Combine into one weighted percentage

MATCH SCORE

$$\Sigma \text{ weight} \times \text{evidence} \div \Sigma \text{ weight}$$

- Required skill: weight 2
- Preferred skill: weight 1
- Evidence: found 1.0, implied 0.5, none 0
- "X or Y": the better of the two counts

Sample run: AI/ML & Data Analytics Intern

79%

Job match

94%

ATS-style estimate

21 requirements checked

Missing: SQL, Prompt Engineering, RAG, FastAPI or Flask, Statistics

Proof 1: real resume and job description

Resume Intelligence

Upload or paste your resume and a job description to get a match score, ATS-style checks, a learning roadmap and interview questions. Everything runs in your browser.

1. Add resume 2. Add job description 3. Analyze 4. Improve

Your resume

Resume text: 495 words

Job description

AI/ML & Data Analytics Intern
Location: Bengaluru / Hyderabad / Pune
Job Type: Internship
Experience: 0-1 years
About the Role
We are looking for a motivated AI/ML & Data Analytics Intern to join our technology team. The candidate will work on data analysis, machine learning experiments, Python-based applications, and AI-driven solutions. The ideal candidate should have a strong foundation in Python, Java, SQL, Data Structures & Algorithms

WHAT THE SCREENSHOT SHOWS

- Resume PDF uploaded and read: 495 words
- Job description pasted: 347 words
- Word counters confirm the real text is loaded, not the sample

Resume Intelligence

8

Proof 2: match score and ATS-style checks

Match: 79%
15 requirements matched, each with resume evidence

ATS-style: 94%
All 11 structure and content checks pass

Proof 3: roadmap and interview questions

The screenshot shows a dark-themed interface with four tabs: 'Match', 'ATS-style', 'Roadmap' (highlighted in pink), and 'Interview'. Below the tabs is a section titled 'Learning roadmap'. It contains five weekly entries, each with a title, a 'Study' task, and a 'Practice' task. The tasks are: Week 1: SQL (Study: Joins, aggregates, indexes; Practice: Write 15 queries on a sample database); Week 2: Prompt Engineering (Study: Prompt patterns: roles, few-shot, structured output; Practice: Build a prompt set for a small task and compare results); Week 3: RAG and vector databases (Study: Embeddings, chunking, vector search; Practice: Build a small RAG Q&A over your own notes); Week 4: FastAPI or Flask (Study: FastAPI routes, validation; Practice: Wrap an ML model in an API); Week 5: Statistics and probability (Study: Descriptive stats, distributions, probability, hypothesis tests; Practice: Analyze a dataset and report findings).

Match ATS-style **Roadmap** Interview

Learning roadmap

Week 1: SQL

- Study: Joins, aggregates, indexes
- Practice: Write 15 queries on a sample database

Week 2: Prompt Engineering

- Study: Prompt patterns: roles, few-shot, structured output
- Practice: Build a prompt set for a small task and compare results

Week 3: RAG and vector databases

- Study: Embeddings, chunking, vector search
- Practice: Build a small RAG Q&A over your own notes

Week 4: FastAPI or Flask

- Study: FastAPI routes, validation
- Practice: Wrap an ML model in an API

Week 5: Statistics and probability

- Study: Descriptive stats, distributions, probability, hypothesis tests
- Practice: Analyze a dataset and report findings

The screenshot shows a dark-themed interface with four tabs: 'Match', 'ATS-style', 'Roadmap', and 'Interview' (highlighted in pink). Below the tabs is a section titled 'Practice questions'. It contains nine numbered questions, each with a category label in a yellow box and a description. The questions are: 1. Strength: Explain Python programming and give an example from your projects. 2. Strength: Explain Java programming and give an example from your projects. 3. Strength: Explain Data Structures & Algorithms and give an example from your projects. 4. Gap: You have little or no evidence of SQL. How would you get productive with it quickly? 5. Gap: You have little or no evidence of Prompt Engineering. How would you get productive with it quickly? 6. Gap: You have little or no evidence of RAG and vector databases. How would you get productive with it quickly? 7. Project: Walk me through your most complex project: design, data, and one trade-off you made. 8. Behavioral: Describe a time you were stuck on a bug and how you resolved it. 9. Role: What would you build in your first month in this role?

Match ATS-style Roadmap **Interview**

Practice questions

- Strength** Explain Python programming and give an example from your projects.
- Strength** Explain Java programming and give an example from your projects.
- Strength** Explain Data Structures & Algorithms and give an example from your projects.
- Gap** You have little or no evidence of SQL. How would you get productive with it quickly?
- Gap** You have little or no evidence of Prompt Engineering. How would you get productive with it quickly?
- Gap** You have little or no evidence of RAG and vector databases. How would you get productive with it quickly?
- Project** Walk me through your most complex project: design, data, and one trade-off you made.
- Behavioral** Describe a time you were stuck on a bug and how you resolved it.
- Role** What would you build in your first month in this role?

Roadmap

One week per missing skill, starting with SQL, with study and practice checkboxes

Interview

Nine questions built from strengths, gaps and the role

Problems found and fixed

PROBLEM

A fixed skill list missed many job skills, so scores were wrong

FIX

Parse the Required and Preferred sections bullet by bullet

PROBLEM

Partial words matched, such as "rest" inside "interest"

FIX

Whole-word matching with skill aliases

PROBLEM

Sample text left in the box gave a misleading ATS score

FIX

Live word counter warns when the text is too short

Roadmap to the full V3 platform

Thank you

Questions and feedback welcome
